

In-Field KeyPlug Updating

To : CET Dealers and End Users
From : J. Bahr

Subject : In-Field Sentinel KeyPlug Updating

CET W32 Application Builder and other CET products use the Rainbow Sentinel Superpro KeyPlug for enabling CET products and options.

CET has released a programs which will permit developer customers to upgrade their product capabilities at their own site.

CETRSKUP : Rainbow Sentinel KeyPlug Update Utility

The CETRSKUP is freely distributed and will become a component of CET Product Releases which use the Rainbow Sentinel KeyPlug. This utility permits the user to upgrade his CET products in the field, without having to send a KeyPlug back to the distributor for programming.

Any W32 App Builder customer who wishes to upgrade his KeyPlug must indicate what changes he/she would like to make : increase the number of concurrent users, enable the library settings, et cetera. This information, together with the KeyPlug serial number (obtained by issuing an OBW32 -V) should be sent to CET Sales at rgibbs@cetsoft.com. CET will respond to the customer with a **password**.

Once a customer has reported his serial number to the distributor, and the distributor has communicated the specific password for the upgrade desired the customer may then use CETRSKUP to update his KeyPlug.

The syntax of this command is:

CETRSKUP <PWORD> <KWORD> <VALUE>

<PWORD> must be the password supplied by the CET Distributor to upgrade this KeyPlug

<KWORD> must be either PROD, NUSR, LOPT, or AUSR with PROD for product type, NUSR for number of concurrent users, LOPT for Library Options and AUSR for number of concurrent ACCESS/Freedom users.

<VALUE> is the new value for this KeyPlug

For example, if a customer requests an upgrade of a W32 Runtime System to a W32 Compiler System, as and has received a password of 2025, the customer would execute CETRSKUP as:

CETRSKUP 2025 PROD WC

which would update his KeyPlug immediately.
